Gods of SPLORR!!

How the game works: a guide to the rules, numbers and behaviour of the simulation

1. The big picture

You are a god. A small tribe of five people lives on a 32x32 grid world with a day/night cycle, a calendar and weather. They split the work between them (foragers, a toolmaker, a firekeeper, a fisher and a hunter), craft tools, fish, hunt rabbits, cook, sew fur coats, dry food for the winter, grow old and die, mostly without your help. You hold **faith**, which you spend on five powers: you can feed them, smite them, or send snakes. The game ends when everyone is dead.

The simulation is deterministic pure logic (Odin, compiled to WebAssembly) driven by a clock; the browser only draws it and passes input. Everything below is taken from the game's source constants.

System	What it does	Source file
World & camera	Weighted terrain generation, zoom, follow, minimap	game.odin
Time	Clock, calendar, latitude-driven temperature and sun	time.odin
People	Vitals, skills, turn logic, ageing, death	people.odin
Food, ground	Berry bushes; fiber, sticks, stone, reeds, fish	food.odin, ground.odin
Items	Hands, recipes, durability, spoilage	items.odin
Fire, fishing, cooking	Pits, fuel, nets, skewers, meals	fire / fishing / cooking.odin
Mood	Dopamine and goal-seeking	mood.odin
Roles	Division of labour around a stockpile	roles.odin
Cold and heat	Chill, hypothermia, heat stress, warmth from fires and coats	thermal.odin
Rabbits	Grazing, breeding prey; meat and fur	rabbits.odin
Winter store	Drying racks and dried food	preserve.odin
Snakes, powers	Predators and the god's faith	snakes.odin, powers.odin

2. The world

Terrain

Each cell is rolled from a weighted table at the start. Grass dominates; dirt appears only when a stone field is exhausted, and slowly greens back to grass next to existing grass (about once per two days).

Terrain	Weight	Provides	Regrowth
Grass	100	5 fiber (also rabbit food)	0.02 / h
Tree	10	5 sticks	0.01 / h (a stick every four days)
Bush	5	berries (max 2.5-10 each), health 10	up to 0.125 / h, temperature-dependent
Stone field	3	20 stone, then becomes dirt	none
Pond	1	6 fish, 6 reeds	fish 0.01 / h, reeds 0.03 / h
Fire pit	built only	8 stick-units of fuel; not walkable	n/a

Time and weather

A game day is 24 hours (1440 real seconds by default), a month 30 days, a year 12 months. Temperature depends on latitude (default 40): an annual mean, a seasonal swing that lags the sun by about three weeks, and a daily swing peaking mid-afternoon. At latitude 40 the annual mean is 8.4 °C with a seasonal swing of about ±14 °C, so winters are well below freezing. A game opens in the last month of spring, about day 60, so the tribe has one summer to prepare.

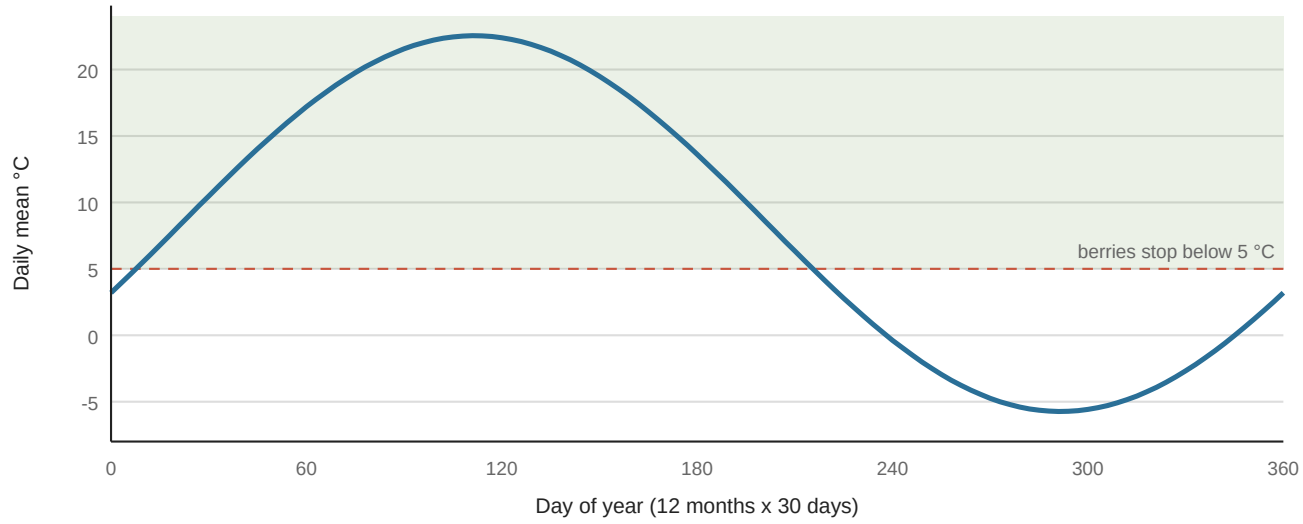

Figure 1. Daily mean temperature through the year at latitude 40. Only about 208 of 360 days sit inside the berry-growing band (shaded); the rest of the year bushes are dormant.

Berries

Bushes regrow at a rate scaled by temperature: nothing below 5 °C or above 38 °C, a peak at 22 °C. A bush holds a random maximum of 2.5 to 10 berries.

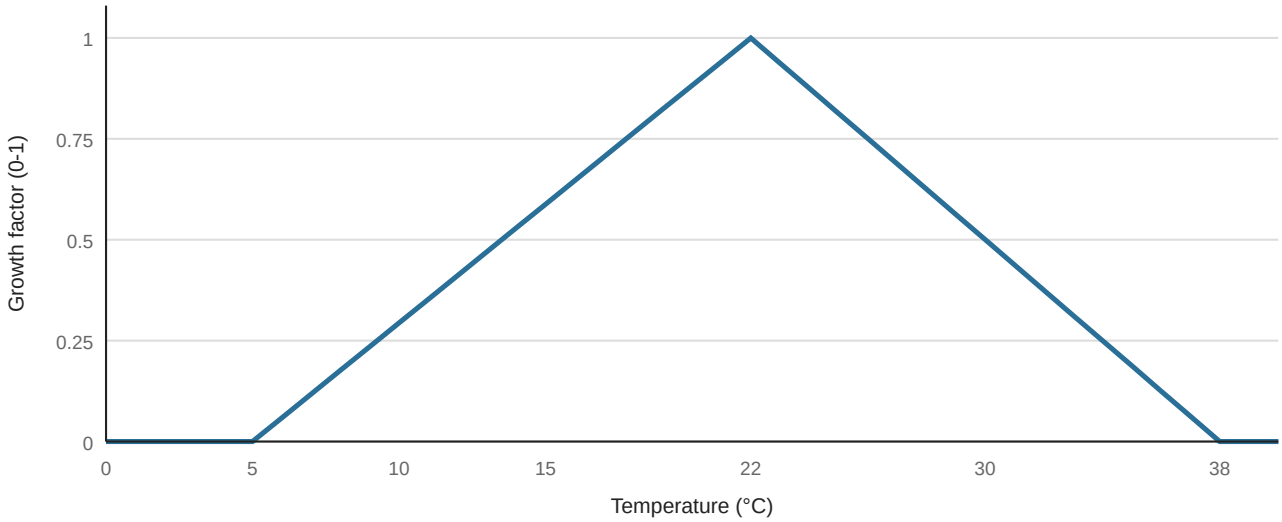

Figure 2. Berry growth factor vs temperature (multiplied by 0.125 berries per hour).

> **Bush health.** A bush has 10 health. A person who fails a forage roll damages it by 1; at zero health the bush is destroyed and all its berries fall to the ground. Bushes mend 0.05 health per hour.

3. People

Each person has a sex, melanin-based skin colour, 2 to 4 hands, an age (16-40 at start) and a lifespan (50-80 years), plus vitals (0-100) and skills that make crafting, foraging, fishing, cooking and spear-throwing succeed more often (an unskilled person still succeeds 25% of the time; a master always).

Hunger and health

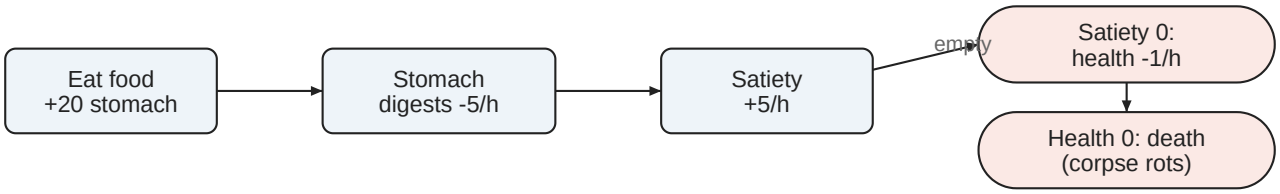

Figure 3. Food passes through the stomach into satiety. With an empty stomach satiety falls 1.5 per hour; at zero satiety health falls 1 per hour.

Quantity	Value
One berry fills the stomach	+20
A cooked meal fills the stomach	+40
Digestion	-5 stomach, +5 satiety per hour
Eats only when satiety is below	85 (and stomach below 25 with food in hand)
Hungry-person food hunt starts	satiety under 60
Dried berries / dried meat	+20 / +30
Sleep need	4 to 12 hours, default 8
Snake poison	5 health per hour; each bite adds 10 hours (max 30)

What a person does each turn

Every ten game minutes each person takes one turn. The rules are tried in order and the first that applies is used; this is what the "Doing" line on the status panel shows.

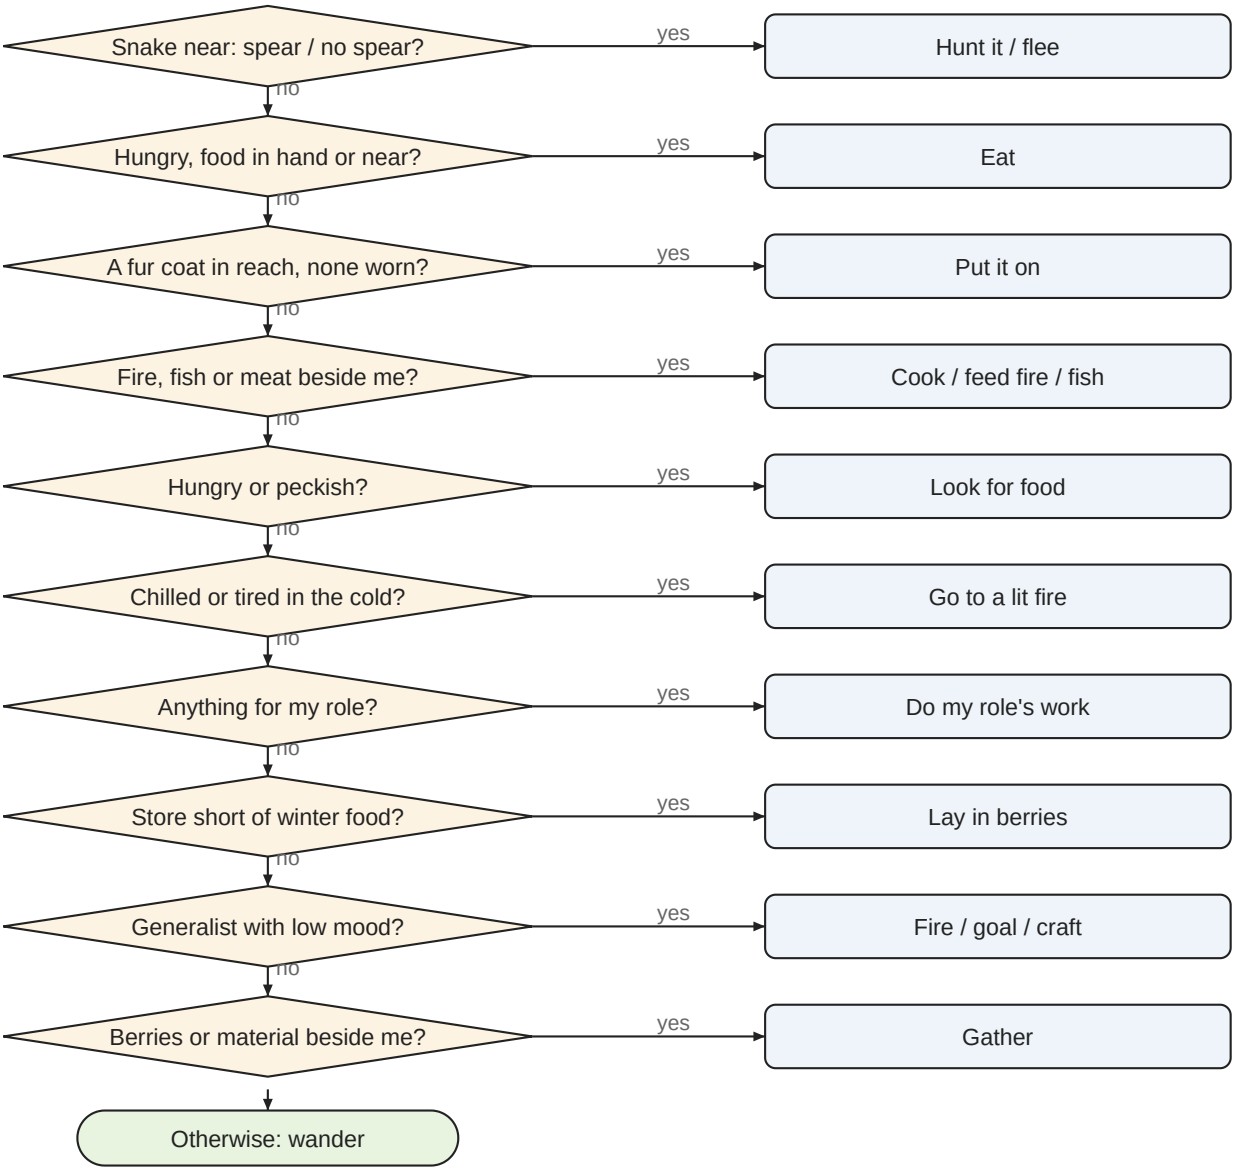

Figure 4. The decision order of a person's turn (asleep people skip it).

4. Crafting and technology

Crafted items take their ingredients from the hands or from the ground at the person's feet, so the tribe's stockpile works as a workbench. A failed craft usually wastes only the last ingredient. Each success raises that item's craft level, which improves the next attempt. A person's first-ever craft of an item pays 4x the mood reward.

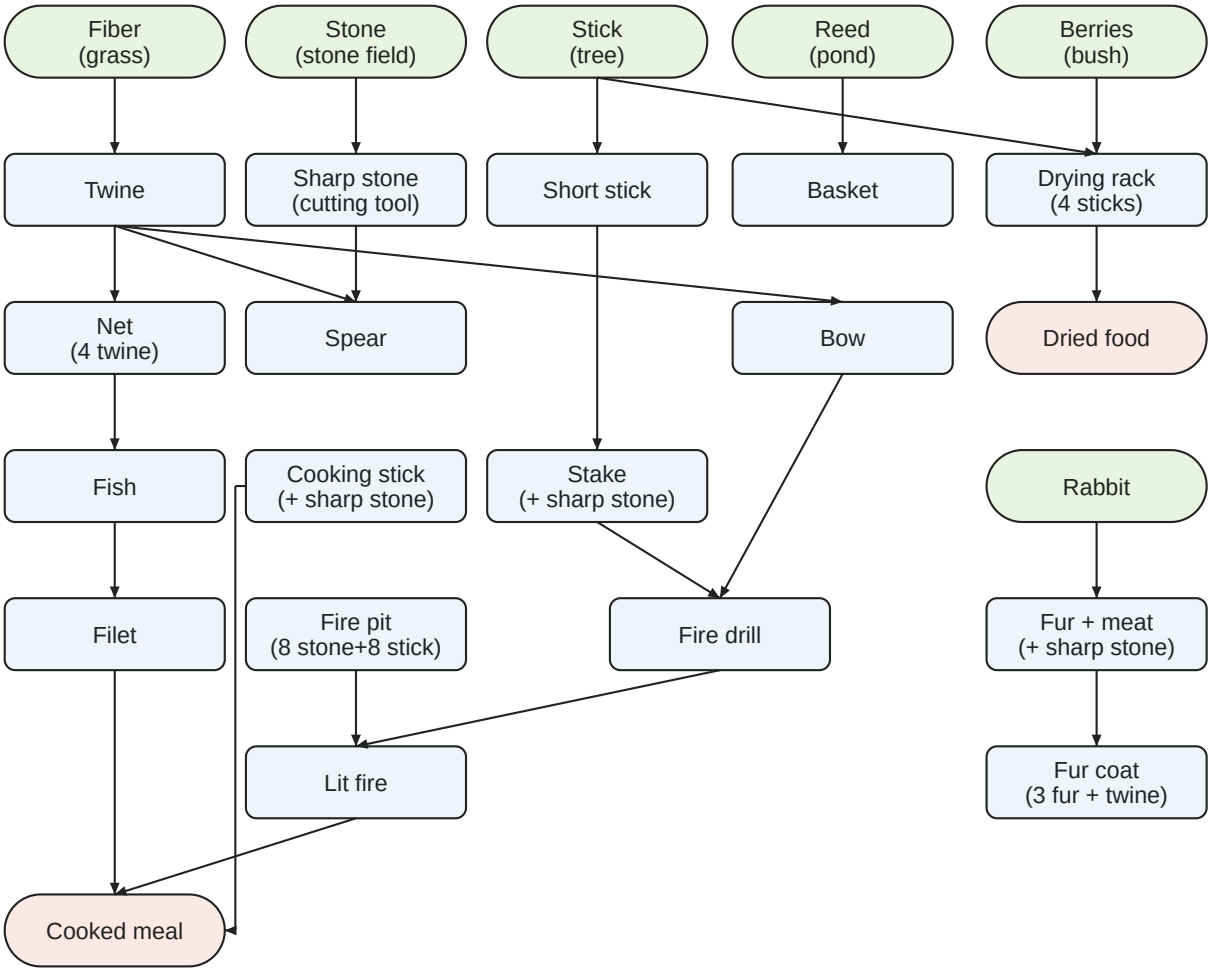

Figure 5. The tech tree. Green boxes are raw materials and prey, blue boxes crafted items, red boxes food made to last or to fill. Every ingredient arrow points to what it helps make.

Item	Ingredients	Use	On failure
Twine	2 fiber	binding for most things	loses a fiber
Sharp stone	2 stone (one is kept)	the cutting tool: skins, fillets, whittles, cuts reeds and sticks	loses the stone
Short sticks	stick, cut with a sharp stone	two parts	loses the stick
Spear	sharp stone, stick, twine	hunt snakes and rabbits	loses the twine
Cooking stick	stick, cut with a sharp stone	skewer for cooking	-
Bow	stick, twine	part of fire drill	loses the twine
Stake	sharp stone on a short stick	part of fire drill	loses the short stick; the stone wears
Fire drill	bow, stake	lights a pit	loses nothing
Fire pit	8 stone + 8 sticks	fire for cooking and warmth	-
Net	4 twine	catch fish	loses 2 twine
Basket	5 reeds	+3 food slots that keep food from rotting	loses a reed
Rope, belt	2 twine / 2 rope	a worn belt adds 4 carry places	loses one input
Fur coat	3 fur + twine	worn at once; 15 °C less cold	loses the twine
Drying rack	4 sticks	dries 6 pieces of food at a time	breaks a stick

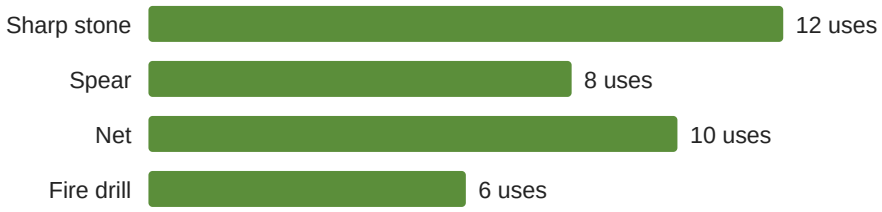

Figure 6. Tool durability: uses before a tool breaks.

Fire, fish and cooking

A fire drill lights a pit that has fuel (wearing the drill). A lit pit burns a stick every four hours, so a full pit of eight sticks lasts a day and a night. People add sticks to nearly empty pits. The firekeeper lights the pit only when the air is under 16 °C: in warm weather a fire is wood wasted. A net catches fish from a pond; a sharp stone cuts a fish into two filets. Raw fish, snake or rabbit meat is skewered on a cooking stick and cooked beside a lit pit; a cooking failure burns the meat. Cooked meals fill the stomach twice as much as a berry.

5. Mood and goals

Each person has **dopamine** (0-100, starting 50, half-life 12 hours). A successful craft pays 10 points, 4x the first time, shrinking by 2% for each success at anything. Catching a fish and cooking a meal pay as well. When dopamine falls under 35 and a generalist (someone with no role, such as a lone survivor) is fed, they pursue a *goal*: the item that would feel best, working back through the recipes and walking to the raw materials. Building a fire pit needs 16 items, so people haul materials trip by trip to a pile at the chosen site and build when it is big enough.

6. Roles: who does what

With two or more people alive, each takes a role, filled in this order by whoever is best suited: forager, toolmaker, firekeeper, fisher, hunter, then more foragers. Roles are handed out again after every death; one person alone does everything as a generalist. Hunger always comes first, whatever the role.

Things are kept on the ground at the **stockpile**, the first person's starting cell. Crafting and cooking use what lies there directly.

Role	Best suited	Work
Forager	foraging	Hauls fiber, stone and sticks to the stockpile (targets 14, 14 and 18), and picks berries for the winter store
Toolmaker	crafting	Makes a sharp stone, net, fire drill, cooking stick, spear and drying racks; skins rabbits; sews fur coats
Firekeeper	cooking	Builds the pit beside the stockpile, lights it in the cold, fillets and cooks, leaves cooked meals out for the hungry, and hangs raw meat to dry when there is no fire
Fisher	fishing	Takes the net, fishes and brings the catch home
Hunter	ranged	Takes the spear and hunts rabbits, leaving a breeding stock; otherwise hauls like a forager

A specialist with nothing to do in their role lays in berries for the winter while the store is short.

7. Cold and heat

Under 10 °C a person builds up **chill** (0.25 per degree per hour, less 1 an hour the body fights off, and 1 more while asleep); over 30 °C they build up **heat**. At 100 the load turns into **hypothermia** or **heat stress**, which cost health in proportion and drain energy faster. Comfortable air clears chill and heat at 4 an hour, but hypothermia and heat stress fade only 0.5 an hour. Deaths are blamed on whichever harm did the most damage: starvation, poison, cold, heat, old age or a god's smiting.

Two things keep the cold off. A **lit fire pit** adds 15 °C right beside it, fading to half that two cells away; in the cold, a chilled or tired person walks to it and stays until warm. A **fur coat** takes 15 °C off the cold wherever its wearer goes (it does nothing about heat).

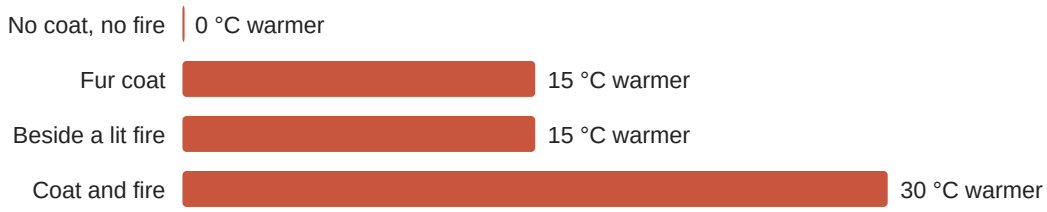

Figure 7. How much warmer the air feels to a person. At latitude 40 winter nights fall near -13 °C.

8. Rabbits and fur

A new world has 8 rabbits on grass (per 32x32). They graze grass fiber, hop towards more when hungry, and starve to a corpse after 48 hours without it. They bolt from people within 3 cells (60% of the time; otherwise they freeze). Fed rabbits breed, each about once every 5 days, while the season's mean is over 8 °C, up to 24. If fewer than 2 are left, one wanders in every 2 days.

A spear thrust kills a rabbit with the same chance as a snake (the hunter's ranged skill against the rabbit's dodge). The hunter only hunts while there are more rabbits than the starting 8, so the warren can breed back. The toolmaker skins each corpse with a sharp stone into rabbit meat and, on a good cut, fur. Three fur and a twine make a **fur coat**; the toolmaker sews one for each person who has none, and a dead person's coat is left on the ground for someone else.

9. The winter store

Berries stop growing when the season's mean falls under 5 °C, roughly from day 215 to day 365. The tribe lives through that on dried food.

- **Racks.** The toolmaker lashes 4 sticks into a drying rack at the stockpile, and builds another (up to 3) when every rack is full. A rack holds 6 pieces of berries or raw meat; after a day they become dried berries or dried meat, which never spoil.
- **Laying in.** While berries grow, the store is under 250 pieces per person, and the bushes have at least 10 berries per person to spare, foragers pick berries for the racks before topping up raw materials (unless one is under a quarter of its target). Idle specialists help, putting down idle tools to free a hand. With no fire lit, the firekeeper dries the stockpile's raw meat instead of letting it rot.
- **Eating from it.** Nobody eats from the store until berries have stopped growing for the year, and even then only with no bush holding berries within 10 steps. Someone close to starving (satiety under 20) may eat from it in any season.

10. Things rot

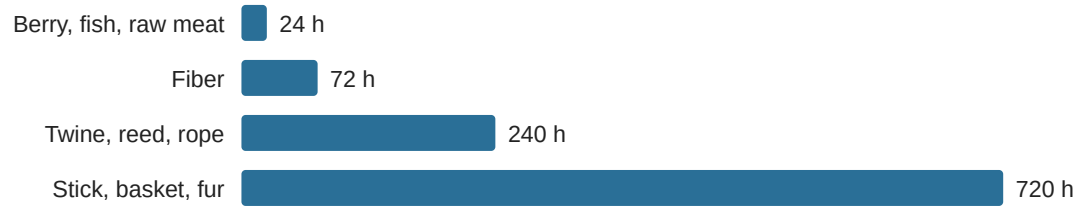

Figure 8. Hours before dropped items spoil.

Figure 9. A dead person lies as a corpse for 5 days, then as a skeleton for 50 days.

Tools, stone, coats, racks and dried food never spoil. Food in a basket keeps too. People also drop what they carry by chance (2% per action), except tools and food kept for the larder.

11. The god: faith and powers

Faith starts at 50, regenerates 2 per hour, and is capped at 100. Arm a power with its button (or key), then click a map cell.

Power	Cost	Effect
Manna	10	Drops a berry on the ground
Smite Bush	15	Scorches a bush away, leaving dirt
Snake	25	A poisonous snake that hunts nearby people and leaves after 72 hours
Smite	30	Kills the person standing there
Miracle Bush	40	A bush holding up to 20 berries, growing 3x faster, in any weather

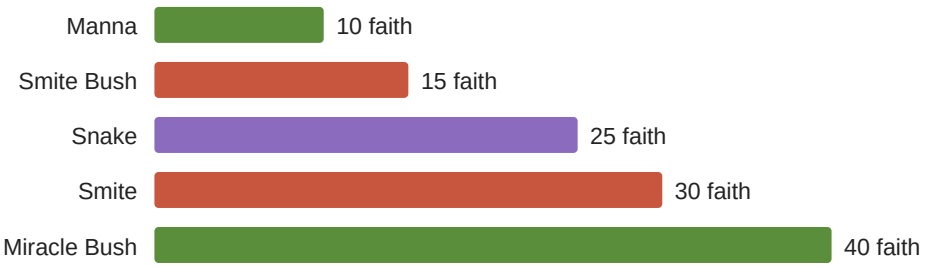

Figure 10. Faith cost of each power (faith regenerates 2 per hour, so Manna every 5 hours).

Snakes

A snake notices people within 6 cells, bites with a 60% chance (one-hour cooldown), and poisons. People within 3 cells flee unless they hold a spear, in which case they hunt it within 5 cells. A spear thrust hits with a chance set by the hunter's ranged skill against the snake's dodge (clamped to 5%-95%). A dead snake can be skinned with a sharp stone into meat and skin.

12. Controls

Input	Action
Arrow keys / WASD, mouse	Move the cursor, pan the view
Z / X, mouse wheel	Zoom in / out (default 15x15 cells, minimum 5)
F / N	Follow a person / follow the next person
Click minimap	Centre the view there (cropped at the edge)
P	Show or hide the miracle panel
M, H, C	Menu, help blurb, credits (Urizen tileset by vurmux, CC0)
R or click after game over	Restart

The window is a 16:9 stage: the map in the middle, the clock, faith and miracle buttons on the left, the minimap, zoom, follow and menu buttons and the status panel on the right. The URL accepts `?day=` (real seconds per game day), `&dpm=`, `&mpy=`, `&lat=` and `?world=N`.

13. How well does the tribe do? (balance report)

A headless test runs 16 random worlds for up to three game years, with no snakes and no divine intervention. When this manual was first written **every tribe starved**, on average after 0.69 years, before or during the first winter. Rabbits, fur coats, working fires and the dried-food store have changed that: **8 of 16 tribes now live through all three years**, and nobody dies of cold.

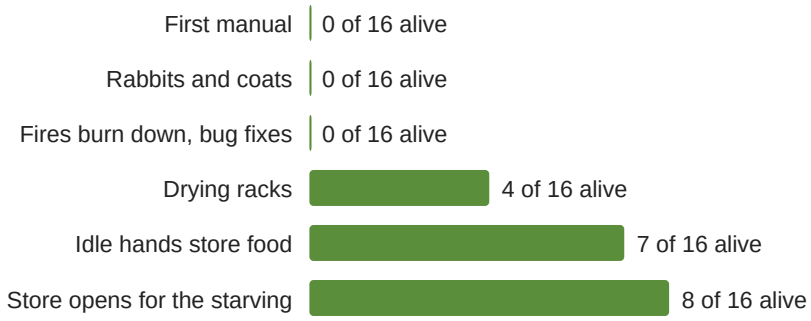

Figure 11. Tribes still alive after three years, as each change landed.

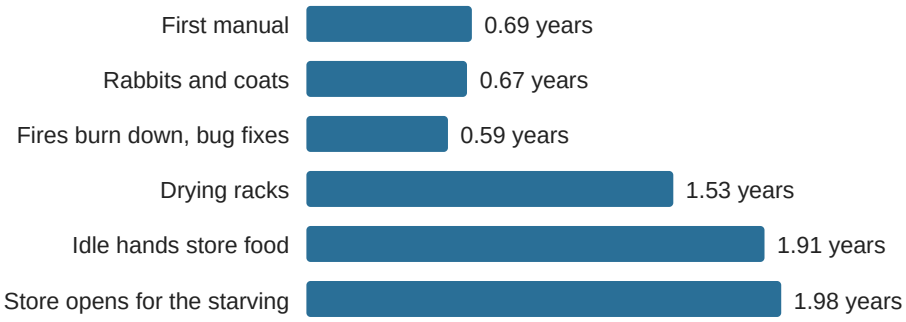

Figure 12. Mean years lived across the 16 worlds (three is the most possible).

The tribes that still die all starve, in one of two ways:

- **A berry-poor first summer.** Worlds with few bushes cannot feed five people and lay in a store at the same time, and the store runs dry in the first winter.
- **A short second year.** A world whose first store just lasted can come out of winter with fish and rabbits hunted out and lay in too little for the next.

Those are your moments as a god: a Miracle Bush bears in any weather, and Manna feeds the starving.
